

ABSTRACT

A bottle carrier device is disclosed which enables the attachment of a plastic beverage bottle or the like to the clothing of a person, or to any other suitable support for transportation and portability of the bottle of liquid. The bottle carrier device generally comprises a bottle-engaging member positionable about the neck of a bottle, a hook member for detachably attaching the bottle carrier device to a support, such as a belt loop, and a joining member which joins together the hook member to the bottle-engaging member. The joining member may further be structured with an intermediate connector to provide selective detachable attachment of the hook member to the bottle-engaging member.
